

SUNRISE- RESIDENTIAL CONCENTRATED SOLAR POWER

How Sunrise works

Concentrator Lens
Sunlight concentrates through the lens boiling fluid into steam

Exergi's Turbine
Steam pushes the turbine disks causing high-speed rotation

Re-condensing Process
After the steam passes through the turbine, it re-condenses back into fluid to repeat the cycle completing the closed-loop system

Powering the Home
The rotation is captured in a motor converting mechanical energy into AC energy powering straight into the home
