

TAKI2GO

The world's leading food and coffee institutions have pledged to accomplish their ESG goals by reducing harmful food packaging. The transition away from plastic has been propelled by the superiority of reuse and supported by groundbreaking policies. Yet, there are no simple or sophisticated reusable food and beverage container systems in place to advance the commission. Our project, Taki2Go is a reusable system that features patent-pending technology, allowing these companies to save money, massively reduce their carbon footprint and reward the general public for doing their part. Our brilliantly-designed, and heavily supported system breaks the most critical barriers to entry and is rooted in environmental justice, allowing all people, including those of lower income, to participate in the new reuse economy!
