

The Gazelle System

By Building Momentum

Solar panels are in harms way during hurricanes. Why is there not a procedure for removal to protect the most valuable asset? The ability to regain or maintain power after a hurricane is critical for recovery.

Current mounting hardware doesn't allow a quick, tool-free removal option. Electrical connectors become difficult to disconnect due to exposure to the elements. Traditional methods don't hinder a removal process for solar installations.

Our Gazelle system provides a set of hardware to allow removal and safe storage of critical power generating solar panel. I will allow a minimal crew to remove about 1000 panels in a day's effort.
