After interviewing 350+ solar companies, we found many are behind in leveraging technology due to costs, implementation barriers, and no options for a single full-function program.

Big companies can invest in custom programs, but this doesn't serve the majority of solar businesses, small and mid-size companies. For them, it even makes business harder. Most companies need 4 to 7 different programs to manage all aspects of their operation, and since these programs weren't built to work together, they lack communication and synergy.

We recognized this is a bottleneck to overall solar deployment and a significant factor in causing soft costs to be higher than what is achievable with technological innovation, so we built the first on-the-shelf solar software with the functionality to do everything from end-to-end. Our goal is to make solutions more accessible and affordable, so we can collectively help underserved groups benefit from solar, as business owners and/or consumers.

Our Solution : All-In-One Solar Software
